

## Coral Feeder

It is important to feed hard corals and anemones directly, as simply placing their food into the water is insufficient. Their food disperses within the water resulting in lack of food and nutrients for the coral and anemones whilst fouling up the water. The Aqua One Coral Feeder is specifically designed for the direct feeding of liquefied and particulate foods to stony corals and other filter feeding marine organisms.

The Coral Feeder can also be used to eradicate detritus and excess debris from hard to reach areas within the aquarium, such as behind rocks, pumps and ornaments.

### Suitable for: Marine & Coral Reef

#### Features & Benefits:

- Specifically designed for the direct feeding of liquefied and particulate foods to stony corals and other filter feeding marine organisms.
- Comes with an extension tube for large aquariums, for ease of reach to corals located at the bottom of the aquarium.
- Can also be used to eradicate detritus and excess debris from hard to reach areas within the aquarium.

#### Notes, Hints & Tips:

- Fill a glass with aquarium water and add the required amount of food. Place the tip of the feeder into the water and squeeze the rubber bulb, slowly release and allow the tube to fill with the liquefied food. Place the tip of the feeder over the coral and slowly squeeze the bulb to release the food.
- For large aquariums, use the extension tube by simply pushing it onto the end of the coral feeder. This will allow you to reach corals that are located at the bottom or rear of the aquarium.
